Answers to Practice Material

LESSON PREVIEW

The punctuation indicator is introduced as we take a closer look at punctuation inside the switches. Summaries are given regarding the use/nonuse of the punctuation indicator. Nemeth grouping symbols are introduced. Code switching within numbered/lettered formats is discussed. Nemeth rules regarding hyphenated expressions are given. An alternate layout option for itemized material is considered.
MORE ABOUT PUNCTUATION

2.1  **Punctuation Mode**

Punctuation mode is determined by whether the punctuation occurs inside or outside of the Nemeth switches. The concept is simple – punctuation that occurs outside of the switch indicators is transcribed in "literary mode" according to the rules of Unified English Braille; punctuation occurring within the switch indicators is transcribed in "mathematical mode" according to the rules of the Nemeth Code. Take another look at this example from Lesson 1, noting that UEB punctuation is used for the question mark and the Nemeth comma and ellipsis are used in the mathematical portion.

**Example 2-1**

What is the secret clue in this series? 5.0, 8.2, 11.4, 14.6, ...

```
WHAT IS A SECRET CLUE In SERIES?
```

2.2 **Spacing of UEB Punctuation and Code Switch Indicators**

As shown in Lesson 1, punctuation that relates to the main text is placed outside of the switch indicators when the surrounding text is in UEB. There is no space between the terminator and the following punctuation.

**Example 2-2**

To begin, divide 64 ÷ 8, then subtract.

```
TO BEGIN DIVIDE LM 64.//8 LE WN SUBTRACT.
```

*Note the use of the literary comma (dot 2) outside of the Nemeth Code terminator.*

**Example 2-3**

Divide 64 ÷ 8—then subtract.

```
DIVIDE LM 64.//8 LE WN SUBTRACT.
```

*The unspaced dash is part of the sentence punctuation and is placed outside of the Nemeth Code terminator.*
Example 2-4

Divide $64 \div 8$ — then subtract.

\[ \text{Divide } 64 \div 8 \text{ then subtract.} \]

The spaced dash is part of the sentence punctuation and is placed outside of the Nemeth Code terminator. The space after the opening Nemeth Code indicator does not represent a space in print.

Example 2-5

We continue ... $8 - 14 = -6$

\[ \text{We continue ... } 8 - 14 = -6 \]

The ellipsis is part of the sentence punctuation and is placed outside of the opening Nemeth Code indicator. A space precedes and follows the ellipsis, as printed. The space after the opening Nemeth Code indicator does not represent a space in print.

2.3 Nemeth Punctuation

When punctuation occurs within mathematical material, excessive code switching is avoided by using Nemeth punctuation. In the example below, the Nemeth comma (dot 6) is used within the series even though the comma itself is not mathematical.

\[ \Rightarrow 5+5, \quad \text{and so on.} \]

Example 2-6

Multiplication can be expressed as a series of addition problems: $5 \times 2 = 5 + 5$, $5 \times 3 = 5 + 5 + 5$, $5 \times 4 = 5 + 5 + 5 + 5$, and so on.

\[ \text{Multiplication can be expressed as a series of addition problems: } 5 \times 2 = 5 + 5, \]

The last comma is placed outside of the switch, as a dot 2 literary comma, because UEB text follows.
Instructions: Consider carefully where to place the code switch indicators and what kind of punctuation to use in these three sentences. Apply 3-1 Nemeth paragraphing.

PRACTICE 2A

72813654, when written as 72 81 36 54, is obviously divisible by 9.

Write these numbers: 3.29, 500, −123, 2,000.88, −250,794. Now add them together.

Is the answer 4.0‰, or is it 4.0%?

PUNCTUATION IN NEMETH CODE

2.4 Background

So far we have looked at punctuation that is unambiguous in mathematical context: the mathematical comma and the short dash. These symbols are not the same as their UEB counterparts.

Mathematical comma

Short dash

When other punctuation marks are transcribed inside the Nemeth switches, the punctuation symbols from UEB are used: the apostrophe, colon, exclamation point, period, question mark, quotation marks,* and semicolon. When a punctuation mark is not preceded by a space, clarification is required because the symbols are formed with the same braille dots as Nemeth numerals and symbols, as demonstrated in this list.

<table>
<thead>
<tr>
<th>Punctuation Mark</th>
<th>Misreading</th>
</tr>
</thead>
<tbody>
<tr>
<td>A semicolon</td>
<td>could be misread in Nemeth as the numeral 2.</td>
</tr>
<tr>
<td>A colon</td>
<td>could be misread in Nemeth as the numeral 3.</td>
</tr>
<tr>
<td>A period</td>
<td>could be misread in Nemeth as the numeral 4.</td>
</tr>
<tr>
<td>An exclamation point</td>
<td>could be misread in Nemeth as the numeral 6.</td>
</tr>
<tr>
<td>A question mark</td>
<td>could be misread in Nemeth as the numeral 8.</td>
</tr>
<tr>
<td>A closing “double” quotation mark</td>
<td>could be misread in Nemeth as the numeral 0.</td>
</tr>
<tr>
<td>A closing “single” quotation mark</td>
<td>could be misread in Nemeth as a comma and the numeral 0.</td>
</tr>
<tr>
<td>An apostrophe</td>
<td>could be misread in Nemeth as a prime sign.</td>
</tr>
</tbody>
</table>

Clarification is achieved by use of the punctuation indicator.

* Only the one-cell “double” quotation marks ⃞⃞ and the two-cell "single" quotation marks ⃞⃞⃞ are used inside the Nemeth switches.
The Punctuation Indicator

2.5 Role of the Punctuation Indicator

A punctuation indicator is placed before one or more of the punctuation marks listed in the box on the previous page when such punctuation is not preceded by a space. (A punctuation indicator is not used at the beginning of a braille line or after a space.) Use of the punctuation indicator assures that the braille is read as punctuation and is not misread as a mathematical symbol.

<table>
<thead>
<tr>
<th>Punctuation Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>➤ 2 ∙ 2 ∙ 2;</td>
</tr>
</tbody>
</table>

_The punctuation indicator prevents the semicolon from being misread as the numeral 2._

Exceptions occur for punctuated words and abbreviations. This will be covered in Lesson 3.

Example 2-7

In this example, a comma separates member pairs; a semicolon separates sets. 2 ∙ 2, 2 ∙ 2 ∙ 2; 3 ∙ 3, 3 ∙ 3 ∙ 3; 4 ∙ 4, 4 ∙ 4 ∙ 4.

A. Example: A comma separates member pairs; a semicolon separates sets: 2 ∙ 2, 2 ∙ 2 ∙ 2; 3 ∙ 3, 3 ∙ 3 ∙ 3; 4 ∙ 4, 4 ∙ 4 ∙ 4.

Although the opening Nemeth Code indicator will fit on line 2, the first math expression will not. With a paragraph, keep each switch indicator on the same line as the mathematics to which it applies, if it will fit. The final period applies to the entire sentence. It is placed after the Nemeth Code terminator.

2.5.1 Two or More Punctuation Marks in a Row. When two or more punctuation marks follow a mathematical item, only one punctuation indicator is used.

➤ "=".

➤ "12%"—"13%"

_Recall from 1.7.3 that a numeric indicator is required following a dash even though that number may not be preceded by a space._

a. If a comma is the second punctuation mark, the mathematical comma is transcribed.

➤ "−",
Example 2-8

Signs for "plus", "minus", and "equals" are "+", "−", "=". × means "times".

A punctuation indicator is not needed for the opening quotation marks because they are each preceded by a space and so will not be misread as numerals.

b. If the first punctuation mark is a comma, a hyphen, or a short dash, a punctuation indicator is needed before the second punctuation mark provided that a punctuation indicator would be required if the first mark was removed and the space which it occupies was not present.

because, without the comma,

because, without the dash,

2.5.2 A Comparison Sign in Quotes. Note that, although a space is generally left between a comparison sign and an expression which precedes or follows it, a space is not left between a comparison sign and a punctuation mark which applies to it.

Observe how this applies to the equals sign in Example 2-8, above.

2.5.3 A Number in Quotes. A numeric indicator is required when a number or a negative number immediately follows an opening quotation mark.

Example 2-9

Add 48 + 13 in your head. Think: "40 + 10 = 50" … "8 + 3 = 11" … "50 + 11 = 61".

Even though this ellipsis is not mathematical (it indicates pausing while thinking), the ellipsis of the Nemeth Code is used because it is inside the
2.5.4 **Digital Clock Time.** Digital clock time is transcribed in UEB unless the time is involved in computation or is part of a number line, in which case Nemeth Code is used. In Nemeth, a punctuation indicator precedes the colon to prevent misreading the colon as the number 3. A numeric indicator is then required to set the reading mode back to "numeric."

\[ \text{3:30} \]

UEB: \#C3\#Cj
Nemeth: \% \#3_3\#30 \_:

Recall from Lesson 1 that the numeric indicator is not restated when a hyphen connects Nemeth numerals.

\[ \text{7:45-8:20} \]

UEB: \#g3\#DE-\#H3\#bj
Nemeth: \% \#7_3\#45-8_3\#20 \_:

**Example 2-10**

Last night, Jayquan arrived at 7:45 and left at 8:20. Use the shortcut method to figure out how many minutes he stayed. \(7:45-8:20 = 15+20 = 35\). Jayquan stayed for 35 minutes.

\[ \text{It is not necessary for the digital time to be transcribed in the same code within the same word problem. UEB is used in the narrative and Nemeth is used in the computation.} \]

2.6 **Punctuation with Omission Signs**

When a sign of omission represents omitted mathematical content the appropriate omission symbol of the Nemeth Code is transcribed and it is punctuated mathematically. The punctuation is unspaced from the omission symbol.

\[ \text{2 × \ldots} \]

\[ \text{2 × \ldots} \]
Take another look at this example from Lesson 1. Notice the use of the mathematical comma with the long dash.

**Example 2-11**

Ways to write "10": __ + 5, ___ − 3, 2 × ___, 50 ÷ ___.

Reminder: A space is inserted between a long dash and an operation symbol. Note that, on line 2, the omission symbol (long dash) is placed on the same line as the rest of its math expression even though there is room for the long dash on the first line.

**Example 2-12**

Fill in the missing numbers in the series: 3, 6, ?, 12, ??, 18.

Switch Decision: These question marks represent omissions and so the Nemeth general omission symbol is required. (Section 1.11.) In order to avoid excessive code switching, the entire series is transcribed in Nemeth even though the numerals themselves could be transcribed in either code. Reminders: The general omission symbol is spaced according to rules of the item it represents (in this case, a numeral). The same number of omission symbols shown in print is used in braille.

2.6.1 **Spacing Exception—The Hyphen.** Although no space is left between an ellipsis and a related punctuation mark or between a long dash and a related punctuation mark, if the punctuation mark is a hyphen then a space is required.

GreaterThan 40% - __ higher

GreaterThan ... − 9.3

**Example 2-13**

Orchids thrive when humidity ranges from 40% - ___. ___ − 80% is considered optimal for most varieties.
2.7 Punctuation and Spacing of Plural or Possessive Endings

When "s" or apostrophe-s is attached to a mathematical item, it becomes part of that expression. This means that the "s" is punctuated mathematically.

\[ \times s: \quad 2 \times s \]

**Example 2-14**

Insert +s or insert \( \times s \): \( 4 \times 2 = 8; \ 8 \times 2 = 10 \).

\[ \times s: \quad 2 \times s \]

Reminder: A mathematical expression must not be divided between braille lines if it will fit on one line within current margins. The expression "4 \( \times 2 = 8 \)" must not be divided and so it begins on line 2.

A punctuation indicator is required before the apostrophe in a possessive ending "apostrophe-s". Even so, a punctuation indicator is still required before a punctuation mark that immediately follows the "s". Compare this similar example to the previous one.

\[ \times 's: \quad 2 \times 's \]

**Example 2-15**

Insert +’s or insert \( \times 's \): \( 4 \times 2 = 8; \ 8 \times 2 = 10 \).

\[ \times 's: \quad 2 \times 's \]

A punctuation indicator is needed both before the apostrophe and before the colon in \( \times 's \).

The ending is unspaced from the symbol even if the symbol normally requires a space.
Instructions: Here is a list of isolated mathematical items and punctuation marks. Transcribe an opening Nemeth Code indicator in cell 1. Start the list on the next line. Begin each line in cell 1, with any runovers in cell 3. Remain in Nemeth throughout the practice, including the clock time. Place a Nemeth Code terminator in cell 1 on the line following the last item in the list.

PRACTICE 2B

+, −; ×, ÷.
+'s, −'s, ×'s, ÷'s; =s, >s, <s.
"::"
5.1, 6.22, 7.333; $8.44, $9.55; $10.66.
10:45-11:25
−16 > −___; 16 < ___.
$1,400 < £ __
5'3" ..., 6'1"—6'2" ..., 7'0".
"8 • 3 = 3 • 8"

2.8 Summary of the Use and Nonuse of the Punctuation Indicator

2.8.1 Situations That Do Not Require a Punctuation Indicator. A punctuation indicator is not required before any of the following punctuation marks. In these isolated examples, assume that the technical material continues after what is shown.

a. The mathematical comma never requires a punctuation indicator.

   ➞ 5.0,  

b. A punctuation indicator is not used before a hyphen or a dash.

   ➞ 5.5-7.0  

   ➞ $47,689—2.6%  

   ➞ "+","—"  

c. A punctuation indicator is not needed if the first character following a space is a punctuation mark or if the punctuation mark begins on a new line.
d. In a sequence of punctuation marks following a mathematical expression, the punctuation indicator precedes only the first punctuation mark.

“=”.

e. In the next lesson, another situation where the punctuation indicator is not required will be presented: after a word or abbreviation.

2.8.2 Situations That Require a Punctuation Indicator. A punctuation indicator is required after any symbol of the type listed below when Nemeth has not been terminated and the mark of punctuation is not a comma, hyphen, or dash. In the following isolated examples, assume that the technical material continues after the final punctuation mark.

a. After a numeric symbol.

“98.6.”

“4.9”

b. After a long dash or after an ellipsis.

“24 = 6 + __.”

“1, 3.1413, … ;”

c. After a general omission symbol.

“15 ÷ 3 = ?.”

d. After a grouping symbol.

“(,8)：“

e. After any of the miscellaneous symbols presented so far.

“100%.”

“48¢?”

f. After a comma, hyphen, or short dash, provided that if these were removed and the space which they occupy were not present, one of the situations above would apply.

“3y,”

“$99—”

Other situations where the punctuation indicator is required will be presented later in this course.
INTRODUCTION TO SIGNS OF GROUPING

2.9 Definition

In mathematical context, symbols such as parentheses, braces, and brackets are not considered to be punctuation; they are classified as signs of grouping. Here are some grouping signs commonly encountered in technical material.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(</td>
<td>Left Parenthesis</td>
</tr>
<tr>
<td>)</td>
<td>Right Parenthesis</td>
</tr>
<tr>
<td>{</td>
<td>Left Curly Brace</td>
</tr>
<tr>
<td>}</td>
<td>Right Curly Brace</td>
</tr>
<tr>
<td>[</td>
<td>Left Square Bracket</td>
</tr>
<tr>
<td>]</td>
<td>Right Square Bracket</td>
</tr>
<tr>
<td>⟨</td>
<td>Left Angle Bracket</td>
</tr>
<tr>
<td>⟩</td>
<td>Right Angle Bracket</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

More signs of grouping will be presented in Lesson 7.

2.10 Signs of Grouping with Numerals

a. The numeric indicator is not used before a numeral that immediately follows a grouping symbol.

\[ (3)(5) \]

Example 2-16

"Three times five" can be written this way: (3)(5).

These parentheses function as mathematical symbols representing multiplication, therefore a switch to Nemeth is required.

b. The numeric indicator is not used after a minus sign that immediately follows a grouping symbol.

\[ |−8| \]
Example 2-17

|−8| is spoken "the absolute value of negative eight."

Example 2-17

2.10.1 Identifiers. Nemeth parentheses are used for the parentheses associated with an identifier that is transcribed inside the code switches.

Lacking a left grouping sign, the numeric indicator is required when the numeral is preceded by a space or begins a braille line.

2.11 Punctuation with Grouping Symbols

Grouping symbols of the Nemeth Code are mathematical symbols and therefore must be punctuated mathematically. Thus, except for the mathematical comma, hyphen, and dash, a punctuation indicator is used before a punctuation mark which follows a sign of grouping.

Example 2-18

What fractions do these percentages represent? ("20%"), ("25%"), ("50%")

Lines 1-2: Punctuation marks which enclose only Nemeth Code material are transcribed inside the switches, using Nemeth symbols. The parentheses, quotation marks, and commas are inside the switches and a punctuation indicator is inserted where required.

Lines 1-2: Reminder: A numeric indicator is required when a numeral immediately follows an opening quotation mark.

Line 3: Although the third percentage will fit on line 2, this would mean the Nemeth Code terminator would be alone on the next line. Separate expressions do not need to be on the same line. The third expression is placed on the same line as the Nemeth Code terminator, which is the preferred layout for embedded material.
2.12 Nested Grouping Symbols

When two or more grouping signs follow one another the outer set may be printed using a taller size in order to visually distinguish the nested groupings. The braille transcription does not differentiate between the sizes—regular grouping symbols are transcribed.

Example 2-19

Perform the inner computations before subtracting. \((4 + 7) - (7 + 4)\)

\[\begin{align*}
\text{Perform the inner computations before subtracting.} \\
\text{In print, the first and last parentheses are taller than the others.}
\end{align*}\]

2.13 Enclosed Technical Material

When parentheses, brackets, braces, or quotation marks enclose a Nemeth symbol or expression, the paired punctuation is transcribed inside the code switches.

Example 2-20

"+" means plus, "−" means minus, and "=" means equals.

Example 2-21

Multiplication can be printed as a dot (\(\cdot\)) or as a cross (\(\times\)).
2.13.1 **Punctuation Following a Sign of Grouping.** Grouping signs of the Nemeth Code are punctuated mathematically. This rule is illustrated by expanding the previous example, continuing in Nemeth following the period.

\[
\text{◡ (×).}
\]

**Example 2-22**

Multiplication can be printed as a dot (·) or as a cross (×). \(12 \cdot 3\) is just another way to write \(12 \times 3\).

\[
\text{◵ Multiplication can be printed as a dot (·) or as a cross (×). 12 \cdot 3 is just another way to write 12 \times 3.}
\]

2.14 **Paired Punctuation**

Paired punctuation marks must be transcribed in the same code. When parentheses or quotation marks enclose Nemeth material, the punctuation is transcribed inside the switches, in Nemeth. However, when paired parentheses or quotation marks enclose a phrase which begins or ends in UEB, the punctuation is transcribed in UEB. Look carefully at the placement of code switch indicators in these examples.

**Example 2-23**

($1.01$ is the correct answer.)

\[
\text{◵ $1.01$ is the correct answer.}
\]

To transcribe both opening and closing parentheses in UEB, the opening Nemeth Code indicator is placed just inside the opening parenthesis.

**Example 2-24**

Al shouted, "The answer is 99¢!"

\[
\text{◵ Al shouted, "The answer is 99¢!"
}\]

The opening quotation mark is in UEB. To match, the closing quotation mark is placed outside of the Nemeth Code terminator.

**Example 2-25**

Al shouted, "The answer is 99¢!" ($1.01$ is the correct answer.)

\[
\text{◵ Al shouted, "The answer is 99¢!" ($1.01$ is the correct answer.)}
\]
It would be incorrect to stay in Nemeth Code to transcribe the punctuation that occurs between these two monetary items because the quotation mark and the parenthesis are paired with UEB symbols outside of the switches.

Spacing with Signs of Grouping

2.15 Spacing Inside of the Grouping Signs

Unless other rules apply, no space is left between an opening or a closing sign of grouping and the material which it encloses.

- \([-4]\)
- \((12\,\text{¢})\)

This includes symbols which usually require spacing—no space is left between a dash, an ellipsis, a sign of comparison, or any other symbol and its sign of grouping.

- \((-)(x) = 4x\)
- \(\|...\|\)
- \((<, =, >)\)

Example 2-26

Circle the correct comparison sign. \(14 ÷ 7 \ (<, =, >) 14 − 7\)

Example 2-27

Angle brackets \(〈 〉\) denote a sequence.

Context will help you determine whether the print sign is an angle bracket or a "less than" or a "greater than" symbol.
2.16 Spacing Outside of the Grouping Signs

The spacing before and after an enclosed expression is subject to the spacing rules for the signs which precede or follow the enclosure.

**Example 2-28**

Perform the multiplication before the addition. \((4 \times 30) + (4 \times 2) = 128\)

**Example 2-29**

Complete the missing values in the range \((0.1) \ldots (0.9)\)

**Example 2-30**

Does \(5 (9 + 7) = (5 \cdot 9) + 7?\)

**Example 2-31**

Multiply, then add. \([ (3) (-1) ] + [ (1) (-3) ]\)
**Instructions:** Format each line or sentence in print as a 3-1 paragraph in braille.

**PRACTICE 2C**

Is \(3(-2.5) + (-4)\) the same as \(3(-2.5 + (-4))\) ?

Use a number line to illustrate this addition problem: \([-4 - (-1)] + [-1 - (-3)]\).

7 + (-3) + (-4) = ?

8 + |(-2) + (-3)| = ?

\(|2(-7.5)| + 3.2(2) = ?\)

The **multiplicative identify** \([sic]\) property is illustrated: \((83)(1) = 83\).

A **unit set** is a set containing only one element. For example, \{9\} is a unit set containing the element "9".

What is the meaning of the symbol "||" in "The answer is ||3.1||"?

A finite decimal (such as 0.152) is one that stops, whereas an infinite decimal (such as 0.9999...) repeats indefinitely.
IDENTIFIERS, cont.

2.17 Identifiers and Braille Page Turns

Itemized problems may begin at the bottom of a braille page and run over to the top of the next braille page. However, do not leave an identifier standing alone at the bottom of a braille page. (See Example 2-32.)

2.17.1 Print Page Number Interference. A math expression may begin in the runover cell of the line following the identifier (line 2) if the space taken up by the print page number on line 1 will not allow it to fit there. Keeping the math expression together on one braille line takes precedence.

Example 2-32

11. Define "comparison sign".
12. \( \frac{14}{7} \) (<, =, >) 14 – 7

Line 25: Item 12 and its math expression will not fit on this line because line length is restricted to 34 cells due to the 2-digit braille page number. Although the identifier will fit, it must not stand alone at the bottom of the page.

Line 1: Item 12 and its math expression will not fit on this line because line length is restricted to 33 cells due to the print page number. The identifier is placed on line 1.

Line 2: The math expression and its two code switch indicators will fit on one line and so are placed here, starting in the runover cell, cell 3.

Note: Section 2.18.2.c below will explain the placement of the code switch indicators in this example.

2.18 Code Switching and Identifiers

2.18.1 A Numbered List of Nemeth Items. You have learned one format for itemized material: 1-3. In this layout, each identifier begins in cell 1. When a numbered list of Nemeth items follows UEB text, place the opening Nemeth Code indicator at the end of the line of text that precedes the list. (See Example 2-33.) If the opening Nemeth Code indicator does not fit at the end of the line that precedes the identified Nemeth material, place it on the next line in the runover position. Note that the code switch indicator does not take the place of the blank line that must precede the list. (See Example 2-34.)
Example 2-33

Ken listed three ways to write "twelve" in a math sentence.

1. 5+7
2. 144 ÷ 12
3. (10 × 6) − (8 × 6)

Example 2-34

Ken's classmates came up with two more ways.

4. |−12|
5. 11.9 + .1

An Itemized List of Mixed Items. Even though an identifier is not part of the math, there is no need to transcribe all of the identifiers in UEB, nor is it necessary to transcribe all of the identifiers in the same code. Each identifier is transcribed according to the rules for the code in use at the time. In a mixture of itemized UEB and Nemeth, the following suggestions are offered. By following these guidelines, the switch indicators will be placed where they are least intrusive to the flow of text and will not interfere with the alignment of the identifiers.
a. **An Itemized List Beginning with Two or More Math Items.** If the first two or more items in the list require Nemeth exclusively, the opening Nemeth Code indicator may be placed as shown in the previous section. Nemeth is terminated after the last math item.

**Example 2-35**

By understanding decimal multiplication, you can mentally calculate the products.

1. \((-0.1) \times (-0.04)\)
2. \((-0.02) \times 0.3\)
3. Write a similar problem.

Line 2: The opening Nemeth Code switch indicator is placed at the end of the narrative.
Line 4: The first identifier is in Nemeth.
Line 5: Nemeth continues, and is then terminated before proceeding to the next item, which is in UEB.
Line 6: UEB resumes.

b. **An Itemized List Beginning with Only One Math Item.** If only the first item in the list requires Nemeth, it is recommended that the switches be placed before and after the math portion only. In other words, the identifier will be in UEB, followed directly by an opening Nemeth Code indicator.

**Example 2-36**

By understanding decimal multiplication, you can mentally calculate the products.

1. \((-0.1) \times (-0.04)\)
2. Write a similar problem.

Line 4: The identifier is in UEB. The switches are placed before and after the math portion only.
Line 5: UEB resumes.
c. **UEB-to-Nemeth.** Similarly, within the list, when UEB is in effect at the end of an item and the beginning of the next item is in Nemeth, transcribe the identifier in UEB and then switch to Nemeth.

*Example 2-37*

True or False?
(1) 98.6 is normal human body temperature expressed in degrees Celsius.
(2) 50% represents the same portion as 0.5.

```
true or false?

\[
\text{\textquoteleft\textquoteleft} 98.6: \text{is normal human body temperature expressed in degrees Celsius.}\text{\textquoteright\textquoteright}
\]
\[
\text{\textquoteleft\textquoteleft} 50\%: \text{represents the same portion as 0.5.}\text{\textquoteright\textquoteright}
\]
```

Line 3: Only the decimal numeral is between the switches.
Line 6: Only the percentage is between the switches.

d. **Nemeth-to-UEB.** When Nemeth is in effect at the end of an item and the beginning of the next item is in UEB, place the Nemeth Code terminator at the end of the Nemeth material and transcribe the next identifier in UEB.

*Example 2-38*

True or False?
(1) 50% represents the same portion as 0.5.
(2) Expressed in degrees Celsius, normal human body temperature is 98.6.

```
true or false?

\[
\text{\textquoteleft\textquoteleft} 98.6: \text{is normal human body temperature expressed in degrees Celsius.}\text{\textquoteright\textquoteright}
\]
\[
\text{\textquoteleft\textquoteleft} 50\%: \text{represents the same portion as 0.5.}\text{\textquoteright\textquoteright}
\]
```

Line 4: Nemeth is terminated before the period.
Line 5: The identifier is in UEB, and UEB continues.
e. **Nemeth-to-Nemeth.** When Nemeth is in effect at the end of an item and the beginning of the next item is also in Nemeth, do not switch out of Nemeth code simply to transcribe the identifier. The identifier will be transcribed following Nemeth rules.

*Example 2-39*

**True or False?**

1. 50% represents the same portion as 0.5.
2. 98.6 is normal human body temperature expressed in degrees Celsius.

1. **TRUE OR FALSE**
2. **50%** \( \equiv \) **SAME**
3. **POR\%** \( \equiv \) **0.5**
4. **98.6** **IS** **NORMAL HUMAN BODY TEMPERATURE**, **DEGREES CELSIUS**

*Line 4: The period requires a punctuation indicator because Nemeth continues.  
Line 5: The identifier uses Nemeth parentheses and the lower-cell numeral. Nemeth is terminated after the decimal numeral.***

---

**PRACTICE 2D**

1) The box is 2′4″ in height.
2) 5′ is the same as 60″
3) 12′ + 15″ = 13′3″
Format

2.19 Keep Together—Hyphenated Expressions

A hyphenated expression containing one or more mathematical components must not be divided between braille lines. Because Nemeth format rules are applied throughout the transcription, this rule also applies in UEB text when a numeral and a word are connected by a hyphen.

Example 2-40

The following problem uses a (1.5-to-1; 2.5-to-1; 3.5-to-1) high torque right-angle gearbox.

Do not divide "24-hour".

Example 2-41

Estimate how many seconds there are in a 24-hour day.

Each identifier begins in cell 1 in the braille transcription, even though they are printed side by side.

2.20 Side-by-Side Layout of Itemized Material

When the print copy arranges itemized material side by side across the page, the braille format is changed so that all identifiers start in cell 1.

Example 2-42

1. 30 \times 90  
2. 71 \times 300  
3. 90 \div 2  
4. 382 + 802
2.21 Code Switching with Listed Items

2.21.1 Unitemized List. Within a list, code switch indicators are placed before and after Nemeth items, as usual. When an unitemized list is composed predominantly or entirely of Nemeth items and the list is preceded and followed by UEB text, the placement of code switches outlined below is recommended. These guidelines apply to a simple vertical list as well as to a simple list in columns.

a. Place the opening Nemeth Code indicator in cell 1 on the line above the first item in the list. The switch indicator does not take the place of the blank line which may be required before the list, according to Braille Formats guidelines.

b. Place the Nemeth Code terminator in cell 1 on the line after the completed list. The switch indicator does not take the place of the blank line which may be required after the list, according to Braille Formats guidelines.

Note that this topic is not addressed in the Nemeth Code. In the lesson exercises, please follow these guidelines when switching codes before or after a list of unnumbered Nemeth items.

2.21.2 Bulleted List. The bullet symbols can be transcribed in either code. There is no need to switch out of Nemeth in order to transcribe a bullet. Follow the code switching guidelines for itemized Nemeth items discussed in Section 2.18.

Example 2-43

- 1 + 6 = 7
- 2 + 5 = 7
- 3 + 4 = 7

2.21.3 Itemized List. Section 2.18 discusses code switching and identifiers in detail.

2.21.4 A List with a Heading. Code switching after a heading will be discussed in Lesson 4.

For further practice, see Appendix A—Reading Practice.

EXERCISE 2

Prepare Exercise 2 for your grader.
ANSWERS TO PRACTICE MATERIAL

PRACTICE 2A

1. Write 5. Write the number 5. Is it divisible by 10?
2. Write the number 5. Is it divisible by 5?
3. Write the number 5. Is it divisible by 2?
4. Write the number 5. Is it divisible by 3?
5. Write the number 5. Is it divisible by 4?
6. Write the number 5. Is it divisible by 6?
7. Write the number 5. Is it divisible by 7?
8. Write the number 5. Is it divisible by 8?

PRACTICE 2B

1. Write the number 1.
2. Write the number 2.
3. Write the number 3.
4. Write the number 4.
5. Write the number 5.
6. Write the number 6.
7. Write the number 7.
8. Write the number 8.
9. Write the number 9.
10. Write the number 10.
11. Write the number 11.
12. Write the number 12.
13. Write the number 13.
PRACTICE 2C

1. Use a number line to illustrate a problem:

   $(-2.5) + (-4)$: The same as $-7$.

2. Use a number line to illustrate a problem:

   $(-2.5 + (-4))$: The same as $-7$.

3. Use a number line to illustrate a problem:

   $(3 + (-2.5) + (-4))$: The same as $-7$.

4. Use a number line to illustrate a problem:

   $(3 + (-2) + (-3))$: The same as $-7$.

5. Use a number line to illustrate a problem:

   $(2(-7.5) + 3.2(2))$: The same as $-7$.

6. Use a number line to illustrate a problem:

   $(3 + (-2.5) + (-4))$: The same as $-7$.

7. Use a number line to illustrate a problem:

   $(3 + (-2) + (-3))$: The same as $-7$.

8. Use a number line to illustrate a problem:

   $(3 + (-2) + (-3))$: The same as $-7$.

9. Use a number line to illustrate a problem:

   $(3 + (-2) + (-3))$: The same as $-7$.

10. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

11. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

12. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

13. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

14. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

15. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

16. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

17. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

18. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

19. Use a number line to illustrate a problem:

     $(3 + (-2) + (-3))$: The same as $-7$.

PRACTICE 2D

1. The box is the same as the height.

2. The box is the same as the height.

3. The box is the same as the height.
